Anatomy

Variants

Article number
Information associated with product. Usually product code or warehouse code.

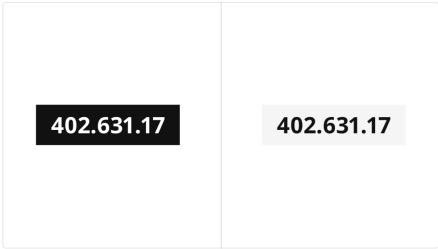

Location code
Location-specific information for product. Usually an area of a store such as section, aisle or bin.

Cabinet code
Identification number used for a combination of articles that make up kitchen cabinets.

Identifier with label
An optional small label to give context to the list items.

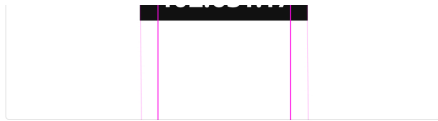

Emphasised and subtle
Product identifiers are available in an emphasised and subtle style. The default for most cases should be emphasised as it provides more contrast against other page information.

Subtle variant should only be used when the context finds emphasised variants counter productive in application.

Behaviours

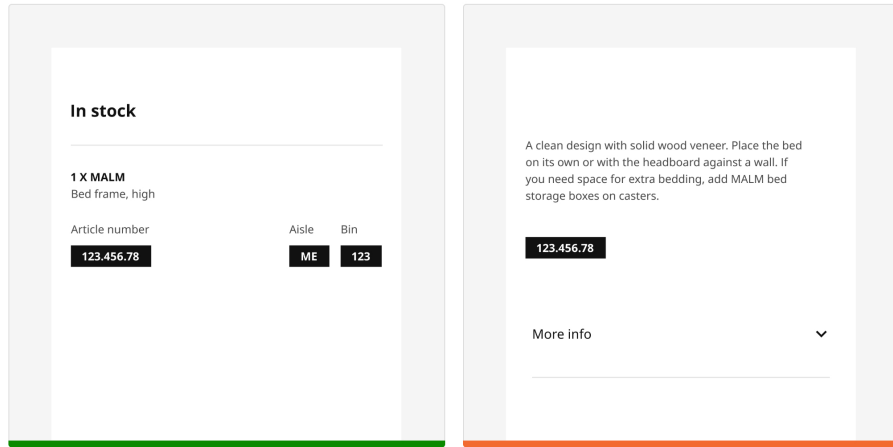

Width sized by content
The container of the identifier will expand and contract with the content, maintaining all padding.

Usage

Ensure clarity of identifier

It is recommended to show a label above the Product Identifier to clearly reflect what the code is representing. This is especially important in scenarios where a Product Identifier, such as an article number, is used independently.

✓ The distinction between the article number and other product information is clear.

⚠ While not wrong, using the Product Identifier without a label when it is being used independently could cause ambiguity of what the code is for.

Internationalisation

RTL Text

Identifier labels flip while the code itself remains as is.
